

Project 1: Commercial Insurance Reporting Automation — Suncorp Insurance

Tools: SQL, Tableau, Excel

- **Business Objective:** Streamlined fragmented reporting across commercial insurance financial, claims, operational, and performance functions to improve reporting consistency, reduce manual dependencies, and accelerate business reviews.
- **Solution Approach:** Evaluated existing reporting workflows, identified opportunities for consolidation, and aligned business definitions and calculation logic across 20+ reports to establish a standardized reporting framework.
- **Development & Validation:** Engineered optimized SQL queries and structured reporting datasets, implemented business transformation rules and Tableau reporting solutions, and conducted source-to-report reconciliation, regression testing, and stakeholder reviews before production deployment.
- **Business Benefits:** Achieved approximately 80% reduction in manual reporting effort, improved data consistency, accelerated report delivery, and established a scalable foundation for automated business reporting.

Project 2: Claims Performance Dashboard — Suncorp Insurance

Tools: Tableau, SQL, Excel

- **Business Objective:** Enabled claims and operational leadership to assess claims performance, identify emerging business trends, and investigate variations across operational segments through a unified performance monitoring solution.
- **Solution Approach:** Translated business priorities into a structured performance measurement framework covering 100+ KPIs, defining metric calculations, analytical dimensions, and drill-down pathways to support detailed claims investigations.
- **Development & Validation:** Implemented complex SQL transformation logic and developed interactive Tableau dashboards with 50+ drill-down dimensions. Validated KPI calculations, filtering scenarios, aggregation logic, and reporting outputs against underlying source data.
- **Business Benefits:** Strengthened claims performance oversight, simplified investigation of operational variances, improved access to detailed performance insights, and supported more informed decisions on claims operations and business priorities.

Project 3: Complaints Performance Dashboard

Tools: Tableau, SQL

- **Business Objective:** Developed a centralized complaints performance reporting solution to provide end-to-end visibility across the complaint lifecycle, including received, acknowledged, open, escalated, and closed complaints.
- **Approach:** Collaborated with business stakeholders to translate reporting requirements into standardized KPIs, business rules, and analytical dimensions, designing scalable SQL-based datasets to support consistent complaints reporting.
- **Development & Validation:** Built interactive Tableau dashboards incorporating 100+ KPIs and metrics, advanced filtering, drill-down analysis, and operational views. Performed data reconciliation, KPI validation, and functional testing to ensure reporting accuracy and reliability.
- **Business Benefits:** Automated complaint reporting and reduced manual reporting effort by approximately 80%, improved visibility into complaint trends and lifecycle performance, and enabled self-service analytics for faster operational and management decisions.

Final note: These three projects now present distinct strengths for internal screening:

- **Project 1:** Process optimization, automation, and end-to-end delivery.
- **Project 2:** Complex SQL, KPI design, and claims performance analysis.
- **Project 3:** Business requirement translation, lifecycle monitoring, and reporting governance.

Keep the 80% reduction figure in both Projects 1 and 3 only if it was independently achieved in each project.
